Abstract

This project helps us to understand how the Agile methodology specifically the Scrum framework is used for the management of the development of the Online Food Ordering System using Jira. The main aim of this project was to understand the management of the software projects in a simple manner. In this project user stories were created for the development of the important features of the Online Food Ordering System like browsing restaurants, viewing the menu, adding items to the cart, ordering food, etc. These user stories were further divided into small tasks, making it easier for us to manage and understand the work. In addition to it a priority for each task were assigned to each and every task.

A sprint was created and all the tasks were added. The progress of the work can be understood by moving the tasks from To Do then to In Progress and then to Done. This would help us in understanding the completion of the tasks step by step as seen in real projects. This project would assist us in understanding the concept of Agile in a simple manner. By this we will get to know how the tasks are managed completed and how the efficient management of the work is understood.

Introduction

This assignment is based on the implementation of Agile methodology using Scrum method. The Jira tool is used to create tasks related to the Online Food Ordering System project. The idea behind this assignment is to learn how a software project is managed in a simple and systematic way. The usage of Jira tool in this assignment helped in creating and managing tasks in a simple manner.

Agile method is very important in the context of the software development field in today's scenario because it provides a platform for flexibility in managing changes in the process of developing a software project [3]. Agile method also helps in managing teams and doing tasks in a stepwise manner rather than doing all tasks at once. Scrum method in Agile provides an opportunity to break up tasks into small parts named sprints, which is very helpful in managing tasks in a better manner.

In this assignment user stories have been created and divided into small tasks, and tasks have been managed using a sprint in Jira.

Problem Statement

The aim and objective of this task are to manage the development of the Online Food Ordering System by using the Agile and Scrum methodologies. The aim and objective of this task are to understand the management and development of software projects in a systematic way.

For this assignment it is necessary to create user stories for the various functions of the system. The user stories are created for functions such as viewing the restaurants viewing the menu adding the items to the cart etc. It is also necessary to divide the user stories into tasks in order to manage the development in a better way. The priority of the task is also assigned according to the priority of the task.

A sprint is also created in Jira and all the tasks are added to the sprint. The progress of the project is also indicated by moving the task to other stages such as To Do In Progress and Done. This is also a way of understanding the way in which the task is completed in a step-by-step manner.

The main objective of this task is to understand how Agile and Scrum help in the management of software development in a simple and efficient manner.

Tools and Technologies Used

In this assignment different tools and technologies have been used to accomplish this in a simple manner. The major tool used is Jira which is used to accomplish this assignment in an effective manner[4]. Jira is used to create user stories divide them into small tasks and organize them in a sprint.

In this assignment the Agile methodology is used to accomplish this in an effective manner. In this assignment the Agile methodology, i.e., Scrum, is used to accomplish this in a step-by-step manner. In this assignment the Scrum methodology is used to plan tasks, prioritize tasks, and track the progress of tasks at different stages, i.e., To-Do, In-Progress, and Done.

In this assignment the web-based platform is used to accomplish this project in an effective manner, i.e., Jira is used to access this tool using a laptop or computer with the help of the web browser. There is no need to use any programming language in this assignment as the major aim is to understand it in an effective manner.

The tools and technologies used in this assignment are effective to accomplish this assignment in a systematic manner.

Methodology

In this assignment the process of Agile with Scrum has been followed for managing the project in a simple manner[5]. The process of Agile with Scrum has been followed step by step for making it easy to understand.

First of all user stories have been developed for the Online Food Ordering System. The user stories include various features such as browsing restaurants, viewing the menu, ordering food etc. The user stories have helped in understanding what exactly the user requires from the system.

Then each and every user story has been divided into small tasks. This has made the work easier for handling and completing it. Each and every task has been prioritized based on their importance.

Then a sprint has been developed using Jira and all the tasks have been included. This has helped in planning the work to be done in a short span of time.

Finally all the tasks have been moved to different stages such as To Do, In Progress, and Done. This method has been followed for making it easy to manage the work in a better manner.

Implementation Details

In this assignment the implementation is done by using Jira to manage the project in a simple and organized way. First the project is created in Jira and user stories are created based on the features of the Online Food Ordering System. The user stories are added and the stories are related to the features of the application, i.e., browsing restaurants, viewing the menu, adding items to the cart, ordering food, and tracking the order.

User stories are divided into smaller tasks which are easier to perform. The tasks are defined in such a way that the work is easily managed in each and every step. After defining the tasks priorities are assigned to the tasks based on the importance of the tasks.

After defining the tasks the sprint is created and all the tasks are assigned to the sprint. The sprint is defined in such a way that the work is planned for a specific time period. The tasks are moved from To Do to In Progress and finally to Done by using the Jira board in the sprint.

This is very simple and helps in managing the work and completing the task in a step-by-step manner.

Experiments Performed

For this assignment a simple experiment was conducted to understand the working of Agile and Scrum methodologies in a real-world project scenario. The primary task was to conduct a sprint using Jira.

The user stories were created and broken down into smaller tasks. These tasks were then assigned to a sprint. During the sprint the tasks were moved from To Do to In Progress and then to Done.

Different tasks were moved at different intervals to understand the actual working in a real-world project scenario. Some tasks were completed and some were in progress. This gave an understanding of the actual working.

The experiment demonstrated the working of Scrum and how it is utilized in organizing the work tracking the progress and completing the tasks in the right order. A clear understanding of how the teams can efficiently manage their work using Agile methodologies is obtained.

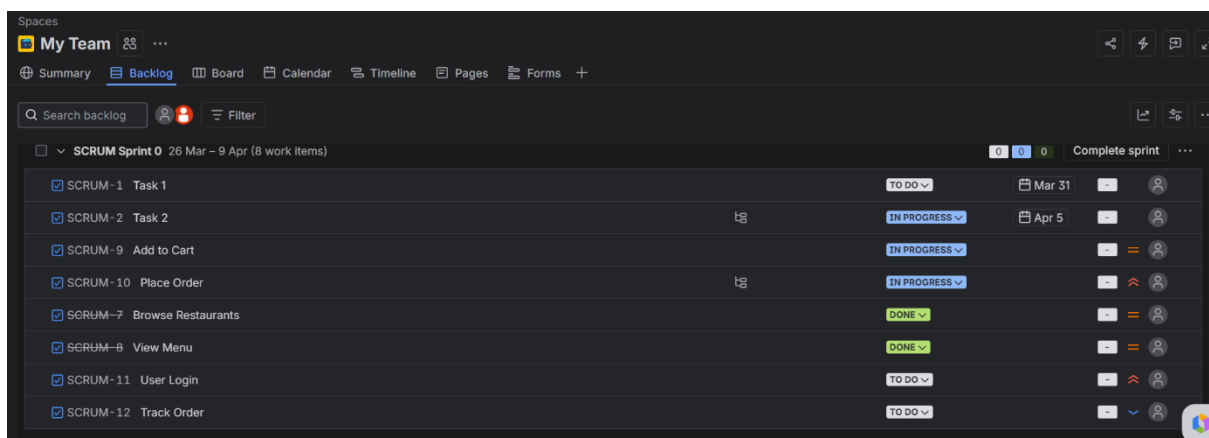

This has been helpful in organizing the work and completing the tasks step by step in a simple and clear manner.

Results and Analysis

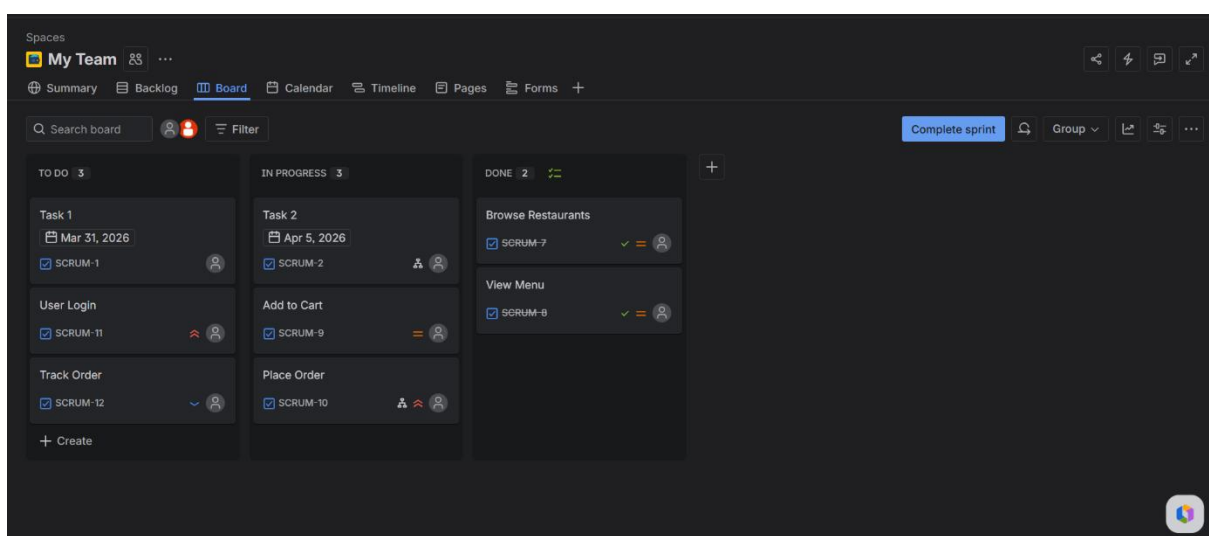

In this assignment the results are observed by using the Jira board and all the tasks are completed in a step-by-step manner. It is observed that some of the tasks are in the Done state which indicates that the tasks are completed. Some of the tasks are in the state of In Progress which indicates that the tasks are still going on. Some of the tasks are in the To Do state which indicates that the tasks are yet to be done.

From the tasks in the Jira board it is observed that the tasks are going on in an efficient way and the priorities and proper planning are helping in completing the tasks in an efficient way.

From this assignment it is clearly visible that the Jira board has given a clear view of the project and is helping in managing the tasks in an efficient way. This indicates that the Agile and Scrum methods are helping in managing the tasks in a simple way.

Fig(b) jira board showing task progress (To Do, In Progress, Done)

Discussion

In this assignment the application of Agile methodology has helped in managing the project in a simple and organized manner. This is because by breaking down the work into small parts it has been easy to understand each part step by step. The creation of user stories has helped in clearly knowing what features to include in the system.

The application of Jira has helped in tracking the progress of tasks. Moving tasks from To Do to In Progress and finally to Done has given a clear idea of how the work is progressing. This has also helped in clearly identifying what tasks are completed and what tasks are pending.

One important observation is that proper planning and prioritization of tasks help in making work more efficient. This is because tasks with high priority were completed first which is important in a real-world situation.

A small challenge encountered in this assignment is how to use Jira but once the process is understood it becomes easy to manage. This assignment has helped in clearly understanding how Agile and Scrum can be applied in a simple and practical way in a real-world situation for software development.

Limitations and Future Work

The limitation of this assignment is that it is just a simulation of the project but it is not an actual application of the project. The Online Food Ordering System is not actually developed through coding rather it is just management through Jira. This project is not actually a representation of the functionality of the system such as ordering food or making a payment.

The second limitation of this assignment is that it is an individual assignment but it is not actually a collaboration of the team which is an important part of Agile methodology.

The future scope of this project is that it can be enhanced to an actual application through coding. This project can be enhanced by adding more features to it such as online payment etc. This project can also be enhanced through the team environment which will show actual knowledge of Agile methodology.

This project can be enhanced to an actual application.

Conclusion

This assignment helped me understand the Agile method and Scrum concepts in a simple manner[3]. This assignment also helped me understand how a project can be planned and managed step by step using Jira.

The user stories were very helpful for understanding the requirements in a simple manner. The division of the user stories into small tasks made it simpler. The use of sprint was very helpful for understanding the tasks within a specific timeframe. The division of the tasks into To Do, In Progress, and Done helped me understand the progress of the work.

This project helped me understand the importance of the Agile method in a real-world scenario, specifically for software development. This project helped me understand the importance of planning and managing the work in a simple manner. This can be very helpful for me in the future.
